(54) Polypeptides with phytase activity.

(57) The present invention is directed to a DNA sequence coding for a polypeptide having phytase activity which DNA sequence is derived from specific groups of fungi, polypeptides encoded by such DNA sequences, vectors comprising such DNA sequences, bacteria or a fungal or yeast host transformed by such DNA sequences or vectors, a process for the preparation of a polypeptide by culturing such transformed hosts and composite feeds comprising one or more such polypeptides.

EP 0 684 313 A2

Phytases (*myo*-inositol hexakisphosphate phosphohydrolases; EC 3.1.3.8) are enzymes that hydrolyze phytate (*myo*-inositol hexakisphosphate) to *myo*-inositol and inorganic phosphate and are known to be valuable feed additives.

A phytase was first described in rice bran in 1907 [Suzuki et al., Bull. Coll. Agr. Tokio Imp. Univ. 7, 495 (1907)] and phytases from Aspergillus species in 1911 [Dox and Golden, J. Biol. Chem. 10, 183-186 (1911)]. Phytases have also been found in wheat bran, plant seeds, animal intestines and in microorganisms [Howsen and Davis, Enzyme Microb. Technol. 5, 377-382 (1983), Lambrechts et al., Biotech. Lett. 14, 61-66 (1992), Shieh and Ware, Appl. Microbiol. 16, 1348-1351 (1968)].

The cloning and expression of the phytase from Aspergillus niger (ficuum) has been described by VanHartingsveldt et al., in Gene, 127, 87-94 (1993) and in European Patent Application, Publication No. 420 358 and from Aspergillus niger var awamori by Piddington et al. in Gene 133, 55-62 (1993).

Since phytases used so far in agriculture have certain disadvantages it is an object of the present invention to provide new phytases or more generally speaking polypeptides with phytase activity against inositol phosphates including phytases ("phytase activity") in large quantities with improved properties. Since it is known that phytases used so far loose activity during the feed pelleting process due to heat treatment, improved heat tolerance would be such a property.

So far phytases have not been reported in thermotolerant fungus with the exception of Aspergillus fumigatus [Dox and Golden et al., J. Biol. Chem. 10, 183-186 (1911)] and Rhizopus oryzae [Howson and Davies, Enzyme Microb. Technol. 5, 377-382 (1993)]. Thermotolerant phytases have been described originating from *Aspergillus terreus* Strain 9A-1 [Temperature optimum 70 °C; Yamada et al., Agr. Biol. Chem. 32, 1275-1282 (1968)] and *Schwanniomyces castellii* [Temperature optimum 77 °C; Segueilha et al., Bioeng. 74, 7-11 (1992)]. However for commercial use in agriculture such phytases must be available in large quantities. Accordingly it is an object of the present invention to provide DNA sequences coding for heat tolerant phytases. Improved heat tolerance of phytases encoded by such DNA sequences can be determined by assays known in the art, e.g. by the processes used for feed pelleting or assays determing the heat dependence of the enzymatic activity itself as described, e.g. by Yamada et al. (s.a.).

It is furthermore an object of the present invention to screen fungi which show a certain degree of thermotolerance for phytase production. Such screening can be made as described, e.g. in Example 1. In this way heat tolerant fungal strains, listed in Example 1, have been identified for the first time to produce a phytase.

Heat tolerant fungal strains, see e.g. those listed in Example 1, can than be grown as known in the art, e.g. as indicated by their supplier, e.g. the American Tissue Type Culture Collection (ATCC), Deutsche Sammlung von Mikroorganismen und Zellkulturen GmbH (DSM), Agricultural Research Service Culture Collection (NRRL) and the Centralbureau voor Schimmelcultures (CBS) from which such strains are available or as indicated, e.g. in Example 2.

Further improved properties are, e.g. an improved substrate specificity regarding phytic acid [myo-inositol (1,2,3,4,5,6) hexakisphosphate] which is a major storage form of phosphorous in plants and seeds. For the complete release of the six phosphate groups from phytic acid an enzyme is required with sufficient activity against phytic acid and all other inositol phosphate molecules. Using e.g. Aspergillus niger phytase requires for this complete release the addition of the pH 2.5 acid phosphatase. Having only one enzyme with the required activity would be of clear advantage. For example, International Patent Application Publication No. 94/03072 discloses an expression system which allows the expression of a mixture of phytate degrading enzymes in desired ratios. However, it would be even more desirable to have both such activities in a single polypeptide. Therefore it is also an object of the present invention to provide DNA sequences coding for such polypeptides. Phytase and phosphatase activities can be determined by assays known in the state of the art or described, e.g. in Example 9.

Another improved property is, e.g. a so called improved pH-profile. This means, e.g. two phytin degrading activity maxima, e.g. one at around pH 2.5 which could be the pH in the stomach of certain animals and another at around pH 5.5 which could be the pH after the stomach in certain animals. Such pH profile can be determined by assays known in the state of the art or described, e.g. in Example 9. Accordingly it is also an object of the present invention to provide DNA sequences coding for such improved polypeptides.

In general it is an object of the present invention to provide a DNA sequence coding for a polypeptide having phytase activity and which DNA sequence is derived from a fungus selected from the group consisting of Acrophialophora levis, Aspergillus terreus, Aspergillus fumigatus, Aspergillus nidulans, Aspergillus sojae, Calcarisporiella thermophila, Chaetomium rectopilium, Corynascus thermophilus, Humicola sp., Mycelia sterilia, Myrococcum thermophilum, Myceliophthora thermophila, Rhizomucor miehei, Sporotrichum cellulophilum, Sporotrichum thermophile, Scytalidium indonesicum and Talaromyces thermophilus or a DNA

sequence coding for a fragment of such a polypeptide which fragment still has phytase activity, or more specifically such a DNA sequence wherein the fungus is selected from the group consisting of Acrophialophora levis, Aspergillus fumigatus, Aspergillus nidulans, Aspergillus terreus, Calcarisporiella thermophila, Chaetomium rectopilium, Corynascus thermophilus, Sporotrichum cellulophilum, Sporotrichum thermophile, Mycelia sterilia, Myceliophthora thermophila and Talaromyces thermophilus, or more specifically such a DNA sequence wherein the fungus is selected from the group consisting of Aspergillus terreus, Myceliophthora thermophila, Aspergillus fumigatus, Aspergillus nidulans and Talaromyces thermophilus. DNA sequences coding for a fragment of a polypeptide of the present invention can, e.g. be between 1350 and 900, preferably between 900 and 450 and most preferably between 450 and 150 nucleotides long and can be prepared on the basis of the DNA sequence of the complete polypeptide by recombinant methods or by chemical synthesis with which a man skilled in the art is familiar with.

Furthermore it is an object of the present invention to provide a DNA sequence which codes for a polypeptide having phytase activity and which DNA sequence is selected from the following:

(a) the DNA sequence of Figure 1 [SEQ ID NO:1] or its complementary strand;

(b) a DNA sequence which hybridizes under standard conditions with sequences defined under (a) or preferably with the coding region of such sequences or more preferably with a region between positions 491 to 1856 of such DNA sequences or even more preferably with a genomic probe obtained by preferably random priming using DNA of Aspergillus terreus 9A1 as described in Example 12.

(c) a DNA sequence which, because of the degeneracy of the genetic code, does not hybridize with sequences of (a) or (b), but which codes for polypeptides having exactly the same amino acid sequences as the polypeptides encoded by these DNA sequences; and

(d) a DNA sequence which is a fragment of the DNA sequences specified in (a), (b) or (c).

"Standard conditions" for hybridization mean in this context the conditions which are generally used by a man skilled in the art to detect specific hybridization signals and which are described, e.g. by Sambrook et al., "Molecular Cloning" second edition, Cold Spring Harbor Laboratory Press 1989, New York, or preferably so called stringent hybridization and non-stringent washing conditions or more preferably so called stringent hybridization and stringent washing conditions a man skilled in the art is familiar with and which are described, e.g. in Sambrook et al. (s.a.) or even more preferred the stringent hybridization and non-stringent or stringent washing conditions as given in Example 12. "Fragment of the DNA sequences" means in this context a fragment which codes for a polypeptide still having phytase activity as specified above.

It is also an object of the present invention to provide a DNA sequence which codes for a polypeptide having phytase activity and which DNA sequence is selected from the following:

(a) the DNA sequence of Figure 2 [SEQ ID NO:3] or its complementary strand;

(b) a DNA sequence which hybridizes under standard conditions with sequences defined under (a) or preferably a region which extends to about at least 80 % of the coding region optionally comprising about between 100 to 150 nucleotides of the 5'end of the non-coding region of such DNA sequences or more preferably with a region between positions 2068 to 3478 of such DNA sequences or even more preferably with a genomic probe obtained by preferably random priming using DNA of Myceliophthora thermophila as described in Example 12.

(c) a DNA sequence which, because of the degeneracy of the genetic code, does not hybridize with sequences of (a) or (b), but which codes for polypeptides having exactly the same amino acid sequences as the polypeptides encoded by these DNA sequences; and

(d) a DNA sequence which is a fragment of the DNA sequences specified in (a), (b) or (c).

"Fragments" and "standard conditions" have the meaning as given above.

It is also an object of the present invention to provide a DNA sequence which codes for a polypeptide having phytase activity and which DNA sequence is selected from the following:

(a) a DNA sequence comprising one of the DNA sequences of Figures 4 [SEQ ID NO:5], 5 [SEQ ID NO:7], 6 [SEQ ID NO:9] or 10 ["aterr21", SEQ ID NO:13: "aterr58": SEQ ID NO:14] or its complementary strand;

(b) a DNA sequence which hybridizes under standard conditions with sequences defined under (a) or preferably with such sequences comprising the DNA sequence of Figure 4 [SEQ ID NO:5] isolatable from Talaromyces thermophilus, or of Figure 5 [SEQ ID NO:7] isolatable from Aspergillus fumigatus, or of Figure 6 [SEQ ID NO:9] isolatable from Aspergillus nidulans or of one or both of the sequences given in Figure 10 ["aterr21", SEQ ID NO:13: "aterr58": SEQ ID NO:14] isolatable from Aspergillus terreus (CBS 220.95) or more preferably with a region of such DNA sequences spanning at least 80 % of the coding region or most preferably with a genomic probe obtained by random priming using DNA of Talaromyces thermophilus or Aspergillus fumigatus or Aspergillus nidulans or Aspergillus terreus (CBS

220.95) as described in Example 12.

(c) a DNA sequence which, because of the degeneracy of the genetic code, does not hybridize with sequences of (a) or (b) but which codes for polypeptides having exactly the same amino acid sequences as the polypeptides encoded by these DNA sequences; and

(d) a DNA sequence which is a fragment of the DNA sequences specified in (a), (b) or (c).

It is furthermore an object of the present inv_ntion to provide a DNA sequence which codes for a polypeptide having phytase activity and which DNA sequence is selected from a DNA sequence comprising the DNA sequence of Figure 4 [SEQ ID NO:5] isolatable from Talaromyces thermophilus, of Figure 5 [SEQ ID NO:7] isolatable from Aspergillus fumigatus, of Figure 6 [SEQ ID NO:9] isolatable from Aspergillus nidulans or of Figure 10 ["aterr21": SEQ ID NO:13; "aterr58":SEQ ID NO:14] isolatable from Aspergillus terreus (CBS 220.95) or which DNA sequence is a degenerate variant or equivalent thereof.

"Fragments" and "standard conditions "have the meaning as given above. "Degenerate variant" means in this context a DNA sequence which because of the degeneracy of the genetic code has a different nucleotide sequence as the one referred to but codes for a polypeptide with the same amino acid sequence. "Equivalent" refers in this context to a DNA sequence which codes for polypeptides having phytase activity with an amino acid sequence which differs by deletion, substitution and/or addition of one or more amino acids, preferably up to 50, more preferably up to 20, even more preferably up to 10 or most preferably 5, 4, 3 or 2, from the amino acid sequence of the polypeptide encoded by the DNA sequence to which the equivalent sequence refers to. Amino acid substitutions which do not generally alter the specific activity are Known in the state of the art and are described, for example, by H. Neurath and R.L. Hill in "The Proteins" (Academic Press, New York, 1979, see especially Figure 6, page 14). The most commonly occurring exchanges are: Ala/Ser, Val/Ile, Asp/Glu, Thr/Ser, Ala/Gly, Ala/Thr, Ser/Asn, Ala/Val, Ser/Gly, Tyr/Phe, Ala/Pro, Lys/Arg, Asp/Asn, Leu/Ile, Leu/Val, Ala/Glu, Asp/Gly as well as these in reverse (the three letter abbreviations are used for amino acids and are standard and known in the art).

Such equivalents can be produced by methods known in the state of the art and described, e.g. in Sambrook et al. (s.a.). Whether polypeptides encoded by such equivalent sequences still have a phytase activity can be determined by one of the assays known in the art or, e.g. described in Example 9.

It is also an object of the present invention to provide one of the aforementioned DNA sequences which code for a polypeptide having phytase activity which DNA sequence is derived from a fungus, or more specifically such a fungus selected from one of the above mentioned specific groups of fungi.

Furthermore it is an object of the present invention to provide a DNA sequence which codes for a polypeptide having phytase activity and which DNA sequence hybridizes under standard conditions with a probe which is a product of a PCR reaction with DNA isolated from a fungus of one of the above mentioned groups of fungi and the following pair of PCR primer:

"ATGGA(C/T)ATGTG(C/T)TC(N)TT(C/T)GA" [SEQ ID NO:15] as sense primer and

"TT(A/G)CC(A/G)GC(A/G)CC(G/A)TG(N)CC(A/G)TA" [SEQ ID NO: 16] as anti-sense primer.

"Standard conditions" have the meaning given above. "Product of a PCR reaction" means preferably a product obtainable or more preferably as obtained by a reaction described in Example 12 referring back to Example 11.

Furthermore it is an object of the present invention to provide a DNA sequence which codes for a polypeptide having phytase activity and which DNA sequence hybridizes under standard conditions with a probe which is a product of a PCR reaction with DNA isolated from Aspergillus terreus (CBS 220.95) and the following two pairs of PCR primers:

(a) "ATGGA(C/T)ATGTG(C/T)TC(N)TT(C/T)GA" [SEQ ID NO:15] as the sense primer and

"TT(A/G)CC(A/G)GC(A/G)CC(G/A)TG(N)CC(A/G)TA" [SEQ ID NO:16] as the anti-sense primer; and

(b) "TA(C/T)GC(N)GA(C/T)TT(C/T)TC(N)CA(C/T)GA" [SEQ ID NO: 17] as the sense primer and

"CG(G/A)TC(G/A)TT(N)AC(N)AG(N)AC(N)C" [SEQ ID NO: 18] as the anti-sense primer.

"Standard conditions" are as defined above and the term "product of a PCR reaction" means preferably a product obtainable or more preferably as obtained by a reaction described in Example 11.

It is furthermore an object of the present invention to provide a DNA sequence coding for a chimeric construct having phytase activity which chimeric construct comprises a fragment of a DNA sequence as specified above or preferably such a DNA sequence wherein the chimeric construct consists at its N-terminal end of a fragment of th Aspergillus niger phytase fused at its C-terminal end to a fragment of the Aspergillus terreus phytase, or more preferably such a DNA sequence with the specific nucleotide sequence as shown in Figure 7 [SEQ ID NO:11] and a degenerate variant or equivalent thereof, wherein "degenerate variant" and "equivalent" have the meanings as given above.

Furthermore it is an object of the present invention to provide a DNA sequence as specified above wherein the encoded polypeptide is a phytase.

Genomic DNA or cDNA from fungal strains can be prepared as known in the art [see e.g. Yelton et al., Procd. Natl. Acad. Sci. USA, 1470-1474 (1984) or Sambrook et al., s.a., or, e.g. as specifically described in Example 2.

The cloning of the DNA-sequences of the present invention from such genomic DNA can than be effected, e.g. by using the well known polymerase chain reaction (PCR) method. The principles of this method are outlined e.g. by White et al. (1989), whereas improved methods are described e.g. in Innis et al. [PCR Protocols: A guide to Methods and Applications, Academic Press, Inc. (1990)]. PCR is an in vitro method for producing large amounts of a specific DNA of defined length and sequence from a mixture of different DNA-sequences. Thereby, PCR is based on the enzymatic amplification of the specific DNA fragment of interest which is flanked by two oligonucleotide primers which are specific for this sequence and which hybridize to the opposite strand of the target sequence. The primers are oriented with their 3' ends pointing toward each other. Repeated cycles of heat denaturation of the template, annealing of the primers to their complementary sequences and extension of the annealed primers with a DNA polymerase result in the amplification of the segment between the PCR primers. Since the extension product of each primer can serve as a template for the other, each cycle essentially doubles the amount of the DNA fragment produced in the previous cycle. By utilizing the thermostable Taq DNA polymerase, isolated from the thermophilic bacteria Thermus aquaticus, it has been possible to avoid denaturation of the polymerase which necessitated the addition of enzyme after each heat denaturation step. This development has led to the automation of PCR by a variety of simple temperature-cycling devices. In addition, the specificity of the amplification reaction is increased by allowing the use of higher temperatures for primer annealing and extension. The increased specificity improves the overall yield of amplified products by minimizing the competition by non-target fragments for enzyme and primers. In this way the specific sequence of interest is highly amplified and can be easily separated from the non-specific sequences by methods known in the art, e.g. by separation on an agarose gel and cloned by methods known in the art using vectors as described e.g. by Holten and Graham in Nucleic Acid Res. 19, 1156 (1991), Kovalic et. al. in Nucleic Acid Res. 19, 4560 (1991), Marchuk et al. in Nucleic Acid Res. 19, 1154 (1991) or Mead et al. in Bio/Technology 9, 657-663 (1991).

The oligonucleotide primers used in the PCR procedure can be prepared as known in the art and described e.g. in Sambrook et al. (1989 "Molecular cloning" 2nd edt., Cold Spring Harbor Laboratory Press, Cold Spring Harbor).

The specific primers used in the practice of the present invention have been designed as degenerate primers on the basis of DNA-sequence comparisons of known sequences of the Aspergillus niger phytase, the Aspergillus niger acid phosphatase, the Saccharomyces cerevisiae acid phosphatase and the Schizosaccharomyces pombe acid phosphatase (for sequence information see, e.g. European Bioinformatics Institute (Hinxton Hall, Cambridge, GB). The degeneracy of the primers was reduced by selecting some codons according to a codon usage table of Aspergillus niger prepared on the basis of known sequences from Aspergillus niger. Furthermore it has been found that the amino acid at the C-terminal end of the amino acid sequences used to define the specific probes should be a conserved amino acid in all acid phosphatases including phytases specified above but the rest of the amino acids should be more phytase than phosphatase specific.

Such amplified DNA-sequences can than be used to screen DNA libraries of DNA of, e.g. fungal origin by methods known in the art (Sambrook et al., s.a.) or as specifically described in Examples 5-7.

Once complete DNA-sequences of the present invention have been obtained they can be integrated into vectors by methods known in the art and described e.g. in Sambrook et al. (s.a.) to overexpress the encoded polypeptide in appropriate host systems. However, a man skilled in the art knows that also the DNA-sequences themselves can be used to transform the suitable host systems of the invention to get overexpression of the encoded polypeptide. Appropriate host systems are for example fungi, like Aspergilli, e.g. Aspergillus niger [ATCC 9142] or Aspergillus ficuum [NRRL 3135] or like Trichoderma, e.g. Trichoderma reesei or yeasts, like Saccharomyces, e.g. Saccharomyces cerevisiae or Pichia, like Pichia pastoris, all available from ATCC. Bacteria which can be used are e.g. E. coli, Bacilli as, e.g. Bacillus subtilis or Streptomyces, e.g. Streptomyces lividans (see e.g. Anné and Mallaert in FEMS Microbiol. Letters 114, 121 (1993). E. coli, which could be used are E. coli K12 strains e.g. M15 [described as DZ 291 by Villarejo et al. in J. Bacteriol. 120, 466-474 (1974)], HB 101 [ATCC No. 33694] or E. coil SG13009 [Gottesman et al., J. Bacteriol. 148, 265-273 (1981)].

Vectors which can be used for expression in fungi are known in the art and described e.g. in EP 420 358, or by Cullen et al. [Bio/Technology 5, 369-376 (1987)] or Ward in Molecular Industrial Mycology, Systems and Applications for Filamentous Fungi, Marcel Dekker, New York (1991), Upshall et al. [Bio/Technology 5, 1301-1304 (1987)] Gwynne et al. [Bio/Technology 5, 71-79 (1987)], Punt et al. [J. of

Biotechnology 17, 19-34 (1991)] and for yeast by Sreekrishna et al. [J. Basic Microbiol. 28, 265-278 (1988), Biochem. 28, 4117-4125 (1989)], Hitzemann et al. [Nature 293, 717-722 (1981)] or in EP 183 070, EP 183 071, EP 248 227, EP 263 311. Suitable vectors which can be used for expression in E. coli are mentioned, e.g. by Sambrook et al. [s.a.] or by Fiers et al. in Procd. 8th Int. Biotechnology Symposium" [Soc. Franc. de Microbiol., Paris (Durand et al., eds.), pp. 680-697 (1988)] or by Bujard et al. in Methods in Enzymology, eds. Wu and Grossmann, Academic Press, Inc. Vol. 155, 416-433 (1987) and Stüber et al. in Immunological Methods, eds. Lefkovits and Pernis, Academic Press, Inc., Vol. IV, 121-152 (1990). Vectors which could be used for expression in Bacilli are known in the art and described, e.g. in EP 405 370, Procd. Nat. Acad. Sci. USA 81, 439 (1984) by Yansura and Henner, Meth. Enzym. 185, 199-228 (1990) or EP 207 459.

Either such vectors already carry regulatory elements, e.g. promotors or the DNA-sequences of the present invention can be engineered to contain such elements. Suitable promotor-elements which can be used are known in the art and are, e.g. for Trichoderma reesei the cbh1- [Haarki et al., Biotechnology 7, 596-600 (1989)] or the pki1-promotor [Schindler et al., Gene 130, 271-275 (1993)], for Aspergillus oryzae the amy-promotor [Christensen et al., Abstr. 19th Lunteren Lectures on Molecular Genetics F23 (1987), Christensen et al., Biotechnology 6, 1419-1422 (1988), Tada et al., Mol. Gen. Genet. 229, 301 (1991)], for Aspergillus niger the glaA- [Cullen et al., Bio/Technology 5, 369-376 (1987), Gwynne et al., Bio/Technlogy 5, 713-719 (1987), Ward in Molecular Industrial Mycology, Systems and Applications for Filamentous Fungi, Marcel Dekker, New York, 83-106 (1991)], alcA- [Gwynne et al., Bio/Technology 5, 71-719 (1987)], suc1- [Boddy et al. Current Genetics 24, 60-66 (1993)], aphA- [MacRae et al., Gene 71, 339-348 (1988), MacRae et al., Gene 132, 193-198 (1993)], tpiA- [McKnight et al., Cell 46, 143-147 (1986), Upshall et al., Bio/Technology 5, 1301-1304 (1987)], gpdA- [Punt et al., Gene 69, 49-57 (1988), Punt et al., J. of Biotechnology 17, 19-37 (1991)] and the pkiA-promotor [de Graaff et al., Curr. Genet. 22, 21-27 (1992)]. Suitable promotor-elements which could be used for expression in yeast are known in the art and are, e.g. the pho5-promotor [Vogel et al., Molecular and Cellular Biology, 2050-2057 (1989); Rudolf and Hinnen, Proc. Natl. Acad. Sci. 84, 1340-1344 (1987)] or the gap-promotor for expression in Saccharamyces cerevisiae und for Pichia pastoris, e.g. the aox1-promotor [Koutz et al. Yeast 5, 167-177 (1989); Sreekrishna et al., J. Basic Microbiol. 28, 265-278 (1988)].

Accordingly vectors comprising DNA sequences of the present invention, preferably for the expression of said DNA sequences in bacteria or a fungal or a yeast host and such transformed bacteria or fungal or yeast hosts are also an object of the present invention.

Once such DNA-sequences have been expressed in an appropriate host cell in a suitable medium the encoded phytase can be isolated either from the medium in the case the phytase is secreted into the medium or from the host organism in case such phytase is present intracellularly by methods known in the art of protein purification or described, e.g. in EP 420 358. Accordingly a process for the preparation of a polypeptide of the present invention characterized in that transformed bacteria or a host cell as described above is cultured under suitable culture conditions and the polypeptide is recovered therefrom and a polypeptide when produced by such a process or a polypeptide encoded by a DNA sequence of the present invention are also an object of the present invention.

Once obtained the polypeptides of the present invention can be characterized regarding their activity by assays known in the state of the art or as described, e.g. by Engelen et al. [J. AOAC Intern. 77, 760-764 (1994)] or in Example 9. Regarding their properties which make the polypeptides of the present invention useful in agriculture any assay known in the art and described e.g. by Simons et al. [British Journal of Nutrition 64, 525-540 (1990)], Schöner et al. [J. Anim. Physiol. a. Anim. Nutr. 66, 248-255 (1991)], Vogt [Arch. Geflügelk. 56, 93-98 (1992)], Jongbloed et al. [J. Anim. Sci., 70, 1159-1168 (1992)], Perney et al. [Poultry Science 72, 2106-2114 (1993)], Farrell et al., [J. Anim. Physiol. a. Anim. Nutr. 69, 278-283 (1993), Broz et al., [British Poultry Science 35, 273-280 (1994)] and Düngethoef et al. [Animal Feed Science and Technology 49, 1-10 (1994)] can be used. Regarding their thermotolerance any assay known in the state of the art and described, e.g. by Yamada et al. (s.a.), and regarding their pH and substrate specificity profiles any assays known in the state of the art and described, e.g. in Example 9 or by Yamada et al., s.a., can be used.

In general the polypeptides of the present invention can be used without being limited to a specific field of application for the conversion of phytate to inositol and inorganic phosphate.

Furthermore the polypeptides of the present invention can be used in a process for the preparation of compound food or feeds wherein the components of such a composition are mixed with one or more polypeptides of the present invention. Accordingly compound food or feeds comprising one or more polypeptides of the present invention are also an object of the present invention. A man skilled in the art is familiar with their process of prepration. Such compound foods or feeds can further comprise additives or components generally used for such purpose and known in the state of the art.

It is furthermore an object of the present invention to provide a process for the reduction of levels of phytate in animal manure characterized in that an animal is fed such a feed composition in an amount effective in converting phytate contained in the feedstuff to inositol and inorganic phosphate.

Examples

Specific media and solutions used

Complete medium (Clutterbuck)

Glucose	10 g/l
-CN solution	10 ml/l
Sodium nitrate	6 g/l
Bacto peptone (Difco Lab., Detroit, MI, USA)	2 g/l
Yeast Extract (Difco)	1 g/l
Casamino acids (Difco)	1.5 g/l
Modified trace element solution	1 ml/l
Vitamin solution	1 ml/l

M3 Medium

Glucose	10 g/l
-CN Solution	10 ml/l
Modified trace element solution	1 ml/l
Ammonium nitrate	2 g/l

M3 Medium - Phosphate

M3 medium except that -CN is replaced with -CNP

M3 Medium - Phosphate + Phytate

M3 Medium - Phosphate with the addition of 5 g/l of Na_{12} Phytate (Sigma #P-3168; Sigma, St. Louis, MO, USA)

Modified trace element solution

CuSO4	0.04%
$FeSO4 \cdot 7H_2O$	0.08%
$Na_2MoO_4 \cdot 2H_2O$	0.08%
$ZnSO_4 \cdot 7H_2O$	0.8%
$B_4Na_2O_7 \cdot 10H_2O$	0.004%
$MnSO_4 \cdot H_2O$	0.08%

Vitamin Solution

Riboflavin	0.1%
Nicotinamide	0.1%
p-amino benzoic acid	0.01%
Pyridoxine/HCl	0.05%
Aneurine/HCl	0.05%
Biotin	0.001%

-CN Solution

KH_2PO_4	140 g/l
$K_2PO_4 \cdot 3H_2O$	90 g/l
KCl	10 g/l
$MgSO_4 \cdot 7H_2O$	10 g/l

-CNP Solution

HEPES	47.6g/200 mls
KCl	2 g/200 mls
$MgSO_4 \cdot 7H_2O$	2 g/200 mls

Example 1

Screening fungi for phytase activity

Fungi were screened on a three plate system, using the following three media:

"M3" (a defined medium containing phosphate),
"M3-P" (M3 medium lacking phosphate) and
"M3-P + Phytate" (M3 medium lacking phosphate but containing phytate as a sole phosphorus source).

Plates were made with agarose to decrease the background level of phosphate.
Fungi were grown on the medium and at the temperature recommended by the supplier. Either spores or mycelium were transfered to the test plates and incubated at the recommended temperature until growth was observed.

The following thermotolerant strains were found to exhibit such growth:
Myceliophthora thermophila [ATCC 48 102]
Talaromyces thermophilus [ATCC 20 186]
Aspergillus fumigatus [ATCC 34 625]

Example 2

Growth of fungi and preparation of genomic DNA

Strains of Myceliophthora thermophila, Talaromyces thermophilus, Aspergillus fumigatus, Aspergillus nidulans, Aspergillus terreus 9A-1, and Aspergillus terreus CBS 220.95 were grown in Potato Dextrose Broth (Difco Lab., Detroit, MI, USA) or complete medium (Clutterbuck). Aspergillus terreus 9A-1 and Aspergillus nidulans have been deposited under the Budapest Treaty for patent purposes at the DSM in Braunschweig, BRD at March 17, 1994 under accession number DSM 9076 and at February 17, 1995 under accession

number DSM 9743, respectively.

Genomic DNA was prepared as follows:

Medium was innoculated at a high density with spores and grown O/N with shaking. This produced a thick culture of small fungal pellets. The mycelium was recovered by filtration blotted dry and weighed. Up to 2.0g was used per preparation. The mycelium was ground to a fine powder in liquid nitrogen and immediately added to 10 mls of extraction buffer (200 mM Tris/HCl, 250 mM NaCl, 25 mM EDTA, 0.5% SDS, pH 8.5) and mixed well. Phenol (7 mls) was added to the slurry and mixed and then chloroform (3 mls) was also added and mixed well. The mixture was centrifuged (20,000 g) and the aqueous phase recovered. RNase A was added to a final concentration of 250 µg/ml and incubated at 37 °C for 15 minutes. The mixture was then extracted with 1 volume of chloroform and centrifuged (10,000 g, 10 minutes). The aqueous phase was recovered and the DNA precipitated with 0.54 volumes of RT isopropanol for 1 hour at RT. The DNA was recovered by spooling and resuspended in water.

The resultant DNA was further purified as follows:

A portion of the DNA was digested with proteinase K for 2 hrs at 37 °C and then extracted repeatedly (twice to three times) with an equal volume of phenol/chloroform and then ethanol precipitated prior to resuspension in water to a concentration of approximately 1 µg/µl.

Example 3

Degenerate PCR

PCR was performed essentially according to the protocol of Perkin Elmer Cetus [(PEC); Norwalk, CT, USA]. The following two primers were used (bases indicated in brackets are either/or):

Phyt 8: 5' ATG GA(CT) ATG TG(CT) TCN TT(CT) GA 3' [SEQ ID NO:19] Degeneracy = 32
Tm High = 60 °C/ Tm Low 52 °C

Phyt 9: 5' TT(AG) CC(AG) GC(AG) CC(GA) TGN CC(GA) TA 3' [SEQ ID NO:20]
Tm High = 70 °C/Tm Low 58 °C

A typical reaction was performed as follows:

H_2O	24.5 µl
10 X PEC GeneAmp Buffer	5 µl
GeneAmp dNTP's (10 mM)	8 µl
Primer 1 (Phyt 8, 100 µM)	5 µl
Primer 2 (Phyt 9, 100 µM)	5 µl
DNA (~1 µg/µl)	1 µl
Taq Polymerase (PEC)	0.5 µl
	50 µl

All components with the exception of the Taq polymerase were incubated at 95 °C for 10 minutes and then 50 °C for 10 minutes and then the reaction placed on ice. The Taq polymerase (Amplitaq, Hoffmann-La Roche, Basel, CH) was then added and 35 cycles of PCR performed in a Triothermoblock (Biometra, Göttingen, DE) according to the following cycle profile:

95 °C/ 60"
50 °C/ 90"
72 °C/ 120"

An aliquot of the reaction was analysed on 1.5% agarose gel.

Example 4

Subcloning and sequencing of PCR fragments

PCR products of the expected size (approximately 146 bp predicted from the Aspergillus niger DNA-sequence) were excised from low melting point agarose and purified from a NACS - PREPAC - column (BRL Life Technologies Inc., Gaithersburg, MD, USA) essentially according to the manufacturer's protocol. The fragment was polyadenylated in 50 µl 100 mM Sodiumcacodylate pH6.6, 12.5 mM Tris/HCl pH 7.0,0.1 mM Dithiothreitol, 125 µg/ml bovine serum albumin, 1 mM $CoCl_2$, 20 µMdATP, 10 units terminal deoxytransferase (Boehringer Mannheim, Mannheim, DE) for 5 minutes at 37 °C and cloned into the p123T

vector [Mitchell et al., PCR Meth. App. 2, 81-82 (1992)].
Alternatively, PCR fragments were purified and cloned using the "Sure Clone" ligation kit (Pharmacia) following the manufacturers instructions.
Sequencing was performed on dsDNA purified on a Quiagen-column
(Diagen GmbH, Hilden, DE) using the dideoxy method and the Pharmacia T7 kit (Pharmacia, LKB Biotechnology AB, Uppsala, SE) according to the protocol supplied by the manufacturer.

Example 5

Construction and Screening of Lambda Fix II libraries

The fragments from *Aspergillus terreus* Strain 9A-1 and *Myceliophthora thermophila* were used to probe Bam HI and BglII southerns to determine the suitable restriction enzyme to use to construct genomic libraries in the Lambda Fix II vector (Strategene, La Jolla, CA, USA). Lambda Fix II can only accept inserts from 9-23 kb. Southerns were performed according to the following protocol. Genomic DNA (10 µg) was digested in a final volume of 200 µl. The reaction without enzyme was prepared and incubated on ice for 2 hours. The enzyme (50 units) was added and the reaction incubated at the appropriate temperature for 3 hours. The reaction was then extracted with an equal volume of phenol/chloroform and ethanol precipitated. The resuspended DNA in loading buffer was heated to 65 °C for 15 minutes prior to separation on a 0.7% agarose gel (O/N 30 V). Prior to transfer the gel was washed twice in 0.2 M HCl/ 10'/room temperature (RT) and then twice in 1M NaCl/0.4M NaOH for 15' at RT. The DNA was transfered in 0.4M NaOH in a capillary transfer for 4 hours to Nytran 13N nylon membrane (Schleicher and Schuell AG, Feldbach, Zürich, CH). Following transfer the membrane was exposed to UV. [Auto cross-link, UV Stratalinker 2400, Stratagene (La Jolla, CA, USA)].
The membrane was prehybridized in hybridization buffer [50 % formamide, 1% sodium dodecylsulfate (SDS), 10% dextransulfate, 4 x SSPE (180 mM NaCl, 10 mM NaH_2PO_4, 1 mM EDTA, ph 7.4)] for 4 hours at 42 °C and following addition of the denatured probe O/N at 42 °C. The blot was washed:

1 x SSPE/0.5 % SDS/RT/30 minutes
0.1 x SSPE/0.1 % SDS/RT/30 minutes
0.1 x SSPE/0.1 % SDS/65 °C/30 minutes

Results indicate that *Aspergillus terreus* Strain 9A-1 genomic DNA digested with BamHI and *Myceliophthora thermophila* genomic DNA digested with BglII produce fragments suitable for cloning into the lambda Fix II vector.
The construction of genomic libraries of *Aspergillus terreus* Strain 9A-1 and Myceliophthora *thermophila* in Lambda Fix II was performed according to the manufacturer's protocols (Stratagene).
The lambda libraries were plated out on 10 137 mm plates for each library. The plaques were lifted to Nytran 13N round filters and treated for 1 minute in 0.5 M NaOH/1.5 M NaCl followed by 5 minutes in 0.5 M Tris-HCl pH 8.0/1.5 M NaCl. The filters were then treated in 2 X SSC for 5 minutes and air dried. They were then fixed with UV (1 minute, UV Stratalinker 2400, Stratagene). The filters were hybridized and washed as above. Putative positive plaques were cored and the phage soaked out in SM buffer (180 mM NaCl, 8 mM $MgSO_4 \cdot 7H_2O$, 20mMTris/HCl pH 7.5, 0.01% gelatin). This stock was diluted and plated out on 137 mm plates. Duplicate filters were lifted and treated as above. A clear single positive plaque from each plate was picked and diluted in SM buffer. Three positive plaques were picked. Two from *Aspergillus terreus* Strain 9A-1 (9A1λ17 and 9A1λ22) and one from *Myceliophthora thermophila* (MTλ27).

Example 6

Preparation of Lambda DNA and confirmation of the clones

Lambda DNA was prepared from the positive plaques. This was done using the "Magic Lambda Prep" system (Promega Corp., Madison, WI, USA) and was according to the manufactures specifications. To confirm the identity of the clones, the lambda DNA was digested with PstI and SalI and the resultant blot probed with the PCR products. In all cases this confirmed the clones as containing sequences complementary to the probe.

Example 7

Subcloning and sequencing of phytase genes

DNA from 9A1λ17 was digested with PstI and the resultant mixture of fragments ligated into pBluescript II SK+ (Stratagene) cut with PstI and treated with shrimp alkaline phosphatase (United States Biochemical Corp., Cleaveland, OH, USA). The ligation was O/N at 16 °C. The ligation mixture was transformed into XL-1 Blue Supercompetent cells (Stratagene) and plated on LB Plates containing 0.5 mM isopropyl-β-D-thiogalactopyranoside (IPTG), 40 µg/ml 5-bromo-4-chloro-3-indoyl-β-D-galactopyranoside (Xgal), 50 µg/ml ampicillin.

DNA from 9Aλ17 was digested with Bgl II and Xba I and the resultant mixture ligated into pBluescript II SK+ digested with BamHI/Xba I. Ligation, transformation and screening were performed as described above.

DNA from MTλ27 was digested with SalI and the resultant mixture of fragments ligated into pBluescript II SK+ cut with SalI and treated with shrimp alkaline phosphatase. The ligation was O/N at 16 °C. The ligation mixture was transformed into XL-1 Blue Supercompetent cells and plated on LB Plates containing Xgal/IPTG and ampicillin.

Colonies from the above transformations were picked and "gridded" approximately 75 to a single plate. Following O/N incubation at 37 °C the colonies were lifted to a nylon filter ("Hybond-N", Amersham Corp., Arlington Heights, IL, USA) and the filters treated with 0.5M NaOH for 3 minutes, 1M Tris/HCl pH7.5 twice for 1 minute, then 0.5M Tris/HCl pH7.5/1.5 M NaCl for 5 minutes. The filters were air dried and then fixed with UV (2 minutes, UV Stratalinker 2400, Stratagene). The filters were hybridized with the PCR products of Example 5. Positive colonies were selected and DNA prepared. The subclones were sequenced as previously described in Example 4. Sequences determined are shown in Figure 1 (Fig. 1) for the phytase from Aspergillus terreus strain 9A1 and its encoding DNA sequence, Figure 2 for the phytase from Myceliophthora thermophila and its encoding DNA-sequence, Figure 3A shows a restriction map for the DNA of Aspergillus terreus (wherein the arrow indicates the coding region, and the strips the regions sequenced in addition to the coding region) and 3B for M. thermophila, and Figure 4 for part of the phytase from Talaromyces thermophilus and its encoding DNA sequence, Figure 5 for part of the phytase from Aspergillus fumigatus and its encoding DNA-sequence and Figure 6 for part of the phytase from Aspergillus nidulans and its encoding DNA-sequence. The sequences for the parts of the phytases and their encoding DNA-sequences from Talaromyces thermophilus, Aspergillus fumigatus and Aspergillus nidulans were obtained in the same way as described for those of Aspergillus terreus strain 9A1 and Myceliophthora thermophila in Examples 2-7. Bases are given for both strands in small letters by the typically used one letter code abbreviations. Derived amino acid sequences of the phytase are given in capital letters by the typically used one letter code below the corresponding DNA-sequence.

Example 8

Construction of a chimeric construct between A. niger and A. terreus phytase DNA-sequences

All constructions were made using standard molecular biological procedures as described by Sambrook et al., (1989) (Molecular cloning, A laboratory Manual, Cold Spring Harbor Laboratory Press, NY).

The first 146 amino acids (aa) of the *Aspergillus niger* phytase, as described in EP 420 358, were fused to the 320 C-terminal aa of the *Aspergillus terreus* 9A1 gene. A NcoI site was introduced at the ATG start codon when the *A. niger* phytase gene was cloned by PCR. The intron found in the A. niger phytase was removed by site directed mutagenesis (Bio-Rad kit, Cat Nr 170-3581; Bio-Rad, Richmond, CA, USA) using the following primer (werein the vertical dash indictes that the sequence to its left hybridizes to the 3'end of the first exon and the sequence to its right hybridizes to the 5'end of the second exon):

5'-AGTCCGGAGGTGACT|CCAGCTAGGAGATAC-3' [SEQ ID NO:21].

To construct the chimeric construct of phytases from A. niger and A. terreus an Eco 47III site was introduced into the A. niger coding sequence to aid cloning. PCR with a mutagenic primer (5' CGA TTC GTA gCG CTG GTA G 3') in conjunction with the T3 primer was used to produce a DNA fragment that was cleaved with Bam HI and Eco 47III. The Bam HI/Eco 47III fragment was inserted into Bam HI/Eco 47III cut p9A1Pst (Example 7). Figure 7 shows the amino acid sequence of the fusion construct and its encoding DNA-sequence.

Example 9

Expression of phytases

Construction of expression vectors

For expression of the fusion construct in A. *niger* an expression cassette was chosen where the fusion gene was under control of the inducible A. *niger* glucoamylase (*glaA*) promoter.
For the complete *A. terreus* 9A1 gene, expression cassettes with the constitutive A. *nidulans* glyceraldehyde-3-phosphate dehydrogenase (*gpdA*) promoter were made.
All genes used for expression in *A. niger* carried their own signal sequence for secretion.

Construction of vector pFPAN1

The *A. niger* glucoamylase (*glaA*) promoter was isolated as a 1960 bp XhoI/ClaI fragment from plasmid pDH33 [Smith et al. (1990), Gene 88: 259-262] and cloned into pBluescriptSK$^+$-vector (pBS) [Stratagene, La Jolla, CA, USA] containing the 710 bp BamHI/XbaI fragment of the *A. nidulans trpC* terminator. The plasmid with the cassette was named pGLAC. The fusion gene, as described in Example 8 , was put under control of the *A. niger glaA* promoter by ligating the blunt ended NcoI/EcoRI fragment to the blunt ended ClaI site and the EcoRV site of plasmid pGLAC. The correct orientation was verified by restriction enzyme digests. The entire cassette was transferred as a KpnI/XbaI fragment to pUC19 (New England Biolabs, GmbH, Schwalbach, BRD), that carried the *Neurospora crassa pyr4* gene (pUC19−*pyr4*), a selection marker in uridine auxotrophic *Aspergilli*, resulting in vector pFPAN1 (see Figure 8 with restriction sites and coding regions as indicated; crossed out restriction sites indicate sites with blunt end ligation).

Construction of vector pPAT1

The A. *nidulans* glyceraldehyd-3-phosphate dehydrogenase (*gpdA*) promoter was isolated as a ~2.3 kb EcoRI/NcoI fragment from plasmid pAN52-1 [Punt et al. (1987), Gene 56: 117-124], cloned into pUC19-NcoI (pUC19 having a SmaI-site replaced by a NcoI-site), reisolated as EcoRI/ BamHI fragment and cloned into pBS with the *trpC* terminator as described above. The obtained cassette was named pGPDN. The *A. terreus* gene was isolatet as a NcoI/EcoRI fragment, where the EcoRI site was filled in to create blunt ends. Plasmid pGPDN was cut with BamHI and NcoI. The BamHI site was filled in to create blunt ends. The NcoI/EcoRI(blunt) fragment of the *A. terreus* gene was cloned between the *gpdA* promoter and *trpC* terminator. The expression cassette was isolated as KpnI/XbaI fragment and cloned into pUC19-*pyr4* resulting in plasmid pPAT1 (see Figure 9; for explanation of abreviations see legend to Figure 8).

Expression of the fusion protein in *Aspergillus niger*

A) Transformation

The plasmid pFPAN1 was used to transform *A. niger* by using the transformation protocol as described by Ballance et al. [(1983), Biochem. Biophys. Res. Commun 112, 284-289] with some modifications:

- YPD medium (1 % yeast extract, 2% peptone, 2 % dextrose) was inoculated with 10^6 spores per ml and grown for 24 hours at 30 • C and 250 rpm
- cells were harvested using Wero-Lene N tissue (No. 8011.0600 Wernli AG Verbandstoffabrik, 4852 Rothrist, CH) and once washed with buffer (0.8 M KCl, 0.05 M $CaCl_2$, in 0.01 M succinate buffer; pH 5.5)
- for protoplast preparation only lysing enzymes (SIGMA L-2265, St. Louis, MO, USA) were used
- the cells were incubated for 90 min at 30 • C and 100 rpm, and the protoplasts were separated by filtration (Wero-Lene N tissue)
- the protoplasts were once washed with STC (1 M sorbitol, 0.05 M $CaCl_2$, 0.01 M Tris/HCl pH 7.5) and resuspended in the same buffer
- 150 µl protoplasts (~10^8/ml) were gently mixed with 10-15 µg plasmid DNA and incubated at room temperature (RT) for 25 min
- polyethylene glycol (60% PEG 4000, 50 mM$CaCl_2$, 10 mM Tris/HCl pH 7.5) was added in three steps, 150 µl, 200 µl and 900µl, and the sample was further incubated at room temperature (RT) for 25 min

- 5 ml STC were added, centrifuged and the protoplasts were resuspended in 2.5 ml YGS (0.5% yeast extract, 2% glucose, 1.2 M sorbitol)
- the sample was incubated for 2 hours at 30° C (100 rpm) centrifuged and the protoplasts were resuspended in 1 ml 1.2 M sorbitol
- the transformed protoplasts were mixed with 20 ml minimal regeneration medium (0.7% yeast nitrogen base without amino acids, 2% glucose, 1 M sorbitol, 1.5% agar, 20 mM Tris/HCl pH 7.5 supplemented with 0.2 g arginine and 10 mg nicotinamide per liter)
- the plates were incubated at 30° C for 3-5 days

B) Expression

Single transformants were isolated, purified and tested for overproduction of the fusion protein. 100 ml M25 medium (70g maltodextrin (Glucidex 17D, Sugro Basel, CH), 12.5g yeast extract, 25g casein-hydrolysate, 2g KH_2PO_4, 2g K_2SO_4, 0.5g $MgSO_4 \cdot 7H_2O$, 0.03g $ZnCl_2$, 0.02g $CaCl_2$, 0.05g $MnSO_4 \cdot 4H_2O$, 0.05g $FeSO_4$ per liter pH 5.6) were inoculated with 10^6 spores per ml from transformants FPAN1#11, #13, #16, #E25, #E30 respectively #E31 and incubated for 5 days at 30° C and 270 rpm. Supernatant was collected and the activity determined. The fusion protein showed the highest activity with phytic acid as substrate at pH 2.5, whereas with 4-nitrophenyl phosphate as substrate it showed two activity optima at pH 2.5 and 5.0 (Table 1).

C) Activity assay

a) Phytic acid

A 1 ml enzyme reaction contained 0.5 ml dialyzed supernatant (diluted if necessary) and 5.4 mM phytic acid (SIGMA P-3168). The enzyme reactions were made in 0.2 M sodium acetate buffer pH 5.0, respectively 0.2 M glycine buffer pH 2.5. The samples were incubated for 15 min at 37° C. The reactions were stopped by adding 1 ml 15% TCA (trichloroacetic acid).

For the colour reaction 0.1 ml of the stopped sample was diluted with 0.9 ml destilled water and mixed with 1 ml reagent solution (3 volumes 1 M H_2SO_4, 1 volume 2.5% $(NH_4)_6Mo_7O_{24}$, 1 volume 10% ascorbic acid). The samples were incubated for 20 min at 50° C and the blue colour was measured spetrophotometrically at 820 nm. Since the assay is based on the release of phosphate a phosphate standard curve, 11 - 45 nmol per ml, was used to determine the activity of the samples.

b) 4-nitrophenyl phosphate

A 1 ml enzyme reaction contained 100 µl dialyzed supernatant (diluted if necessary) and 1.7 mM 4-nitrophenyl phosphate (Merck, 6850, Darmstadt, BRD). The enzyme reactions were made in 0.2 M sodium acetate buffer pH 5.0, respectively 0.2 M glycine buffer pH 2.5. The samples were incubated for 15 min at 37° C. The reactions were stopped by adding 1 ml 15% TCA.

For the determination of the enzyme activity the protocol described above was used.

[1)] not tranformed

Expression of the *Aspergillus terreus* 9A1 gene in *Aspergillus niger*

A. niger NW205 was transformed with plasmid pPAT1 as described above. Single transformants were isolated, purified and screened for overproduction of the *A. terreus* protein. 50 ml YPD medium were inoculated with 10^6 spores per ml from transformants PAT1#3, #10, #11, #13 and #16 and incubated for 3 days at 30 * C and 270 rpm. Supernatant was collected and the activity determined as described above except that the pH for the enzyme reactions were different. The enzyme showed its main activity at pH 5.5 with phytic acid as substrate and at pH 3.5 with 4-nitrophenyl phosphate as substrate (Table 2).

Example 10

Fermentation of *Aspergillus niger* NW 205 transformants

A) Transformant FPAN1#11

Preculture medium [30 g maltodextrin (Glucidex 17D), 5 g yeast extract, 10 g casein-hydrolysate, 1 g KH_2PO_4, 0.5g $MgSO_4 \cdot 7H_2O$, 3 g Tween 80 per liter; pH 5.5] was inoculated with 10^6 spores per ml in a shake flask and incubated for 24 hours at 34° C and 250 rpm.
A 10 liter fermenter was inoculated with the pre-culture to a final dilution of the pre-culture of 1:100. The batch fermentation was run at 30° C with an automatically controlled dissolved oxygen concentration of minimum 25% ($pO_2 \geq 25\%$). The pH was kept at 3.0 by automatic titration with 5 M NaOH.
The medium used for the fermentation was: 35 g maltodextrin, 9.4 g yeast extract, 18.7 g casein-hydrolysate, 2 g KH_2PO_4, 0.5 g $MgSO_4 \cdot 7H_2O$, 2 g K_2SO_4, 0.03 g $ZnCl_2$, 0.02 g $CaCl_2$, 0.05 g $MnSO_4 \cdot 4H_2O$, 0.05 g $FeSO_4$ per liter; pH 5.6.
Enzyme activities reached after 3 days under these conditions were 35 units/ml respectively 16 units/ml at pH 2.5 respectively pH 5.0 with phytic acid as substrate and 295 units/ml respectively 90 units/ml at pH 2.5 respectively pH 5.0 and 4-nitrophenyl phosphate as substrate.

B) Transformant PAT1#11

Preculture, inoculation of the fermenter and the fermentation medium were as described above, except that the pH was kept at 4.5 by automatic titration with 5 M NaOH.
Enzyme activities reached after 4 days under these conditions were 17.5 units/ml at pH 5.5 with phytic acid as substrate and 2 units/ml at pH 3.5 with 4-nitrophenyl phosphate as substrate.

Example 11

Isolation of PCR fragments of a phytase gene of *Aspergillus terreus* (CBS 220.95)

Two different primer pairs were used for PCR amplification of fragments using DNA of *Aspergillus terreus* [CBS 220.95]. The primers used are shown in the Table below.

Fragment amplified	Primers	Oligonucleotide sequences (5' to 3')
8 plus 9 about 150 bp	8	ATGGA(C/T)ATGTG(C/T)TC(N)TT(C/T)GA [SEQ ID NO:8]
		Amino acids 254-259: MDMCSF
	9	*TT(A/G)CC(A/G)GC(A/G)CC(G/A)TG(N)CC(A/G)TA* [SEQ ID NO:9]
		Amino acids 296-301: YGHGAG
10 plus 11 about 250 bp	10	TA(C/T)GC(N)GA(C/T)TT(C/T)TC(N)CA(C/T)GA [SEQ ID NO:10]
		Amino acids 349-354: YADFSH
	11	*CG(G/A)TC(G/A)TT(N)AC(N)AG(N)AC(N)C* [SEQ ID NO:11]
		Amino acids 416-422: RVLVNDR

DNA sequences in bold show the sense primer and in italics the antisense primer. The primers correspond to the indicated part of the coding sequence of the *Aspergillus niger* gene. The combinations used are primers 8 plus 9 and 10 plus 11. The Taq-Start antibody kit from Clontech (Palo Alto, CA, USA) was used according to the manufacturer's protocol. Primer concentrations for 8 plus 9 were 0.2 mM and for primers 10 plus 11 one mM. Touch-down PCR was used for amplification [Don, R.H. et al. (1991), Nucleic Acids Res. 19, 4008]. First the DNA was denatured for 3 min at 95°C. Then two cycles were done at each of the following annealing temperatures: 60°C, 59°C, 58°C, 57°C, 56°C, 55°C, 54°C, 53°C, 52°C and 51°C, with an annealing time of one min. each. Prior to annealing the incubation was heated to 95°C for one min and after annealing elongation was performed for 30 sec at 72°C. Cycles 21 to 35 were performed as follows: denaturation one min at 95°C, annealing one min at 50°C and elongation for 30 sec at 72°C.

Two different PCR fragments were obtained. The DNA sequences obtained and their comparison to relevant parts of the phytase gene of Aspergillus terreus 9A1 are shown in Figure 10 [relevant parts of the phytase gene of *Aspergillus terreus* 9A1 "9A1"(top lines) (1) and the PCR fragments of *Aspergillus terreus* CBS 220.95 "aterr21" (bottom lines). Panel A: Fragment obtained with primer pair 8 plus 9 (aterr21). Panel B: Fragment obtained with primer pair 10 plus 11 (aterr58). DNA sequences of *Aspergillus terreus* CBS 220.95 (top lines) are compared with those of *Aspergillus terreus* 9A1 (1) (bottom lines). Panel A: The bold **gc** sequence (bases 16 plus 17) in the aterr21 fragment could possibly be **cg** (DNA sequencing uncertainty). Panel B: The x at position 26 of the aterr58 PCR fragment could possibly represent any of the four nucleotides].

Example 12

Cross hybridizations under non-stringent and stringent washing conditions

Five µg's of genomic DNA of each strain listed in Table 3 were incubated with 4 units of *Hind*III or *Pst*I, respectively, per µg of DNA at 37°C for 4 hours. After digestion, the mixtures were extracted with phenol and DNAs were precipitated with ethanol. Samples were then analyzed on 0.8% agarose gels. DNAs were transferred to Nytran membranes (Schleicher & Schuell, Keene, NH, USA) using 0.4M NaOH containing 1M NaCl as transfer solution. Hybridizations were performed for 18 hours at 42°C. The hybridization solution contained 50% formamide, 1% SDS, 10% dextran sulphate, 4 x SSPE (1 x SSPE = 0.18M NaCl, 1 mM EDTA, 10 mM NaH_2PO_4, pH 7.4), 0.5% blotto (dried milk powder in H_2O) and 0.5 mg salmon sperm DNA per ml. The membranes were washed under non-stringent conditions using as last and most-stringent washing condition incubation for 30 min at room temperature in 0.1 x SSPE containing 0.1% SDS. The probes (labelled at a specific activity of around 10^9 dpm/µg DNA) used were the PCR fragments generated with primers 8 plus 9 (see Example 11) using genomic DNA of *Myceliophthora* thermophila; ***Mycelio. thermo.***, ; *Aspergillus nidulans*, ***Asperg. nidul.***; *Aspergillus fumigatus*, ***Asperg. fumig.***,; *Aspergillus terreus* 9A1, ***Asperg. terreus 9A1***. *Talaromyces thermophilus*, ***Talarom. thermo***. The **MT2** genomic probe was obtained by random priming (according to the protocol given by Pharmacia, Uppsala, Sweden) and spans 1410 bp, from the BspEI site upstream of the N-terminus of the ***Mycelio. thermo.*** phytase gen to the PvuII site in the C-terminus (positions 2068 to 3478). The **AT2** genomic probe was obtained by random priming and spans 1365 bp, from the ApaI site to the NdeI site of the **Asperg. terreus 9A1** phytase gene (positions 491 to 1856). The **AN2** DNA probe was obtained by random priming and spans the complete coding sequence (1404 bp) of the *Asperg. niger* gene (EP 420 358). Results are given in Table 3. [""except for weak signal corresponding to a non-specific 20kb fragment; In case of the very weak cross-hybridization signal at 20 kb seen with DNA from *Aspergillus niger* using the PCR fragment from *Talaromyces thermophilus* this signal is unspecific, since it differs significantly from the expected 10 kb *HindIII* fragment, containing the phytase gene; "" signal due to only partical digest of DNA].

For cross-hybridizations with stringent washing conditions membranes were further washed for 30 min. at 65°C in 0.1 x SSPE containing 0.1% SDS. Results are shown In Table 4 [(1) only the 10.5-kb HindIII fragment is still detected, the 6.5-kb HIndIII fragment disappeared (see table 3)].

(D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(xi) SEQUENCE DESCRIPTION: SEQ ID NO: 21:

AGTCCGGAGG TGACTCCAGC TAGGAGATAC 30

Claims

1. A DNA sequence coding for a polypeptide having phytase activity and which DNA sequence is derived from a fungus selected from the group consisting of Acrophialophora levis, Aspergillus terreus,

Aspergillus fumigatus, Aspergillus nidulans, Aspergillus sojae, Calcarisporiella thermophila, Chaetomium rectopilium, Corynascus thermophilus, Humicola sp., Mycelia sterilia, Myrococcum thermophilum, Myceliophthora thermophila, Rhizomucor miehei, Sporotrichum cellulophilum, Sporotrichum thermophile, Scytalidium indonesicum and Talaromyces thermophilus or a DNA sequence coding for a fragment of such a polypeptide which fragment still has phytase activity.

2. A DNA sequence according to claim 1 wherein the fungus is selected from the group consisting of Acrophialophora levis, Aspergillus fumigatus, Aspergillus nidulans, Aspergillus terreus, Calcarisporiella thermophila, Chaetomium rectopilium, Corynascus thermophilus, Sporotrichum cellulophilum, Sporotrichum thermophile, Mycelia sterilia, Myceliophthora thermophila and Talaromyces thermophilus.

3. A DNA sequence according to claim 2 wherein the fungus is selected from the group consisting of Aspergillus terreus, Myceliophthora thermophila, Aspergillus fumigatus, Aspergillus nidulans and Talaromyces thermophilus.

4. A DNA sequence which codes for a polypeptide having phytase activity and which DNA sequence is selected from the following:
(a) the DNA sequence of Figure 1 [SEQ ID NO:1] or its complementary strand;
(b) a DNA sequence which hybridizes under standard conditions with sequences defined under (a);
(c) a DNA sequence which, because of the degeneracy of the genetic code, does not hybridize with sequences of (a) or (b), but which codes for polypeptides having exactly the same amino acid sequences as the polypeptides encoded by these DNA sequences; and
(d) a DNA sequence which is a fragment of the DNA sequences specified in (a), (b) or (c).

5. A DNA sequence which codes for a polypeptide having phytase activity and which DNA sequence is selected from the following:
(a) the DNA sequence of Figure 2 [SEQ ID NO:3] or its complementary strand;
(b) a DNA sequence which hybridizes under standard conditions with sequences defined under (a);
(c) a DNA sequence which, because of the degeneracy of the genetic code, does not hybridize with sequences of (a) or (b), but which codes for polypeptides having exactly the same amino acid sequences as the polypeptides encoded by these DNA sequences; and
(d) a DNA sequence which is a fragment of the DNA sequences specified in (a), (b) or (c).

6. A DNA sequence which codes for a polypeptide having phytase activity and which DNA sequence is selected from the following:
(a) a DNA sequence comprising one of the DNA sequences of Figures 4 [SEQ ID NO:5], 5 [SEQ ID NO:7], 6 [SEQ ID NO:9]or 10 [SEQ ID NO: 13 and/or SEQ ID NO:14] or its complementary strand;
(b) a DNA sequence which hybridizes under standard conditions with sequences defined under (a);
(c) a DNA sequence which, because of the degeneracy of the genetic code, does not hybridize with sequences of (a) or (b) but which codes for polypeptides having exactly the same amino acid sequences as the polypeptides encoded by these DNA sequences; and
(d) a DNA sequence which is a fragment of the DNA sequences specified in (a), (b) or (c).

7. A DNA sequence which codes for a polypeptide having phytase activity and which DNA sequence is selected from a DNA sequence comprising the DNA sequence of Figure 4 [SEQ ID NO:5] isolatable from Talaromyces thermophilus, of Figure 5 [SEQ ID NO:7] isolatabel from Aspergillus fumigatus, of Figure 6 [SEQ ID NO:9] isolatable from Aspergillus nidulans or of Figure 10 [SEQ ID NO:13 and/or SEQ ID NO:14] isolatable from Aspergillus terreus (CBS 220.95) or which DNA sequence is a degenerate variant or aequivalent thereof.

8. A DNA sequence as claimed in any one of claims 4 to 6 which codes for a polypeptide having phytase activity which DNA sequence is derived from a fungus.

9. A DNA sequence according to claim 8 wherein the fungus is selected from a group as defined in claim 1, 2 or 3.

10. A DNA sequence which codes for a polypeptide having phytase acitivity and which DNA sequence hybridizes under standard conditions with a probe which is a product of a PCR reaction with DNA

isolated from a fungus as defined in any one of claims 1 to 3 and the following pair of PCR primer:
"ATGGA(C/T)ATGTG(C/T)TC(N)TT(C/T)GA" [SEQ ID NO:15] as sense primer and
"TT(A/G)CC(A/G)GC(A/G)CC(G/A)TG(N)CC(A/G)TA" [SEQ ID NO:16] as anti-sense primer.

11. A DNA sequence which codes for a polypeptide having phytase activity and which DNA sequence hybridizes under standard conditions with a probe which is a product of a PCR reaction with DNA isolated from Aspergillus terreus (CBS 220.95) and the following two pairs of PCR primers:
(a) "ATGGA(C/T)ATGTG(C/T)TC(N)TT(C/T)GA" [SEQ ID NO:15] as the sense primer and
"TT(A/G)CC(A/G)GC(A/G)CC(G/A)TG(N)CC(A/G)TA" [SEQ ID NO:16] as the anti-sense primer; and
(b) "TA(C/T)GC(N)GA(C/T)TT(C/T)TC(N)CA(C/T)GA" [SEQ ID NO: 17] as the sense primer and
"CG(G/A)TC(G/A)TT(N)AC(N)AG(N)AC(N)C" [SEQ ID NO: 18] as the anti-sense primer.

12. A DNA sequence coding for a chimeric construct having phytase activity which chimeric construct comprises a fragment of a DNA sequence as claimed in any one of claims 1 to 11.

13. A DNA sequence coding for a chimeric construct as defined in claim 12 which chimeric construct consists at its N-terminal end of a fragment of the Aspergillus niger phytase fused at its C-terminal end to a fragment of the Aspergillus terreus phytase.

14. A DNA sequence as claimed in claim 13 with the specific nucleotide sequence as shown in Figure 7 [SEQ ID NO:11] and a degenerate variant or aequivalent thereof.

15. A DNA sequence as claimed in any one of claims 1 to 14 wherein the encoded polypeptide is a phytase.

16. A polypeptide encoded by a DNA sequence as claimed in any one of claims 1 to 15.

17. A vector comprising a DNA sequence as claimed in any one of claims 1 to 15.

18. A vector as claimed in claim 17 suitable for the expression of said DNA sequence in bacteria or a fungal or a yeast host.

19. Bacteria or a fungal or yeast host transformed by a DNA sequence as claimed in any one of claims 1 to 15 or a vector as claimed in claim 17 or 18.

20. A composit food or feed comprising one or more polypeptides as defined in claim 16.

21. A process for the preparation of a polypeptide as claimed in claim 16 characterized in that transformed bacteria or host cell as claimed in claim 19 is cultured under suitable culture conditions and the polypeptide is recovered therefrom.

22. A polypeptide when produced by a process as claimed in claim 21.

23. A process for the preparation of a composit feed or food wherein the components of the composition are mixed with one or more polypeptides as defined in claim 16.

24. A process for the reduction of levels of phytate in animal manure characterized in that an animal is fed a composit feed as defined in claim 20 in an amount effective in converting phytate contained in the feedstuff to inositol and inorganic phosphate.

25. Use of a polypeptide according to claim 16 for the conversion of phytate to inositol phosphates, inositol and inorganic phosphate.
